Core Insights and Recommendations

Potential for growth and next steps

04

Predictive Analysis and Conclusions

How is May looking and final takeaways

01

Framework

Data to Decisions

THE DATA ENGINEERING PIPELINE

Bronze Layer Cleansing

Removed 1437 duplicates

Standardized Currency to SGD

Converted Indonesian to Decimal Odds format

Constant Value Replacement

Silver to Gold Enrichment

Client Segmentation

Name/Description columns for IDs

Group columns for high-level comparison

Flags for critic filtering

STRATEGIC MEASUREMENT

Defining Core KPIs

KPI	Formula	Why?
GGR	Total Stakes – Total Payouts	Are we being profitable?
Hold %	GGR / Total Stakes	How much money I keep from the bets
ARPU	GGR / Unique Clients	Are my clients doing good?

DRIVING BUSINESS VALUE

Leveraged the refined dataset to identify a **Hold rate** and optimized **client retention strategies**

Integrated Tech Stack

Used for ETL pipeline and visualization

02

Sales Summary

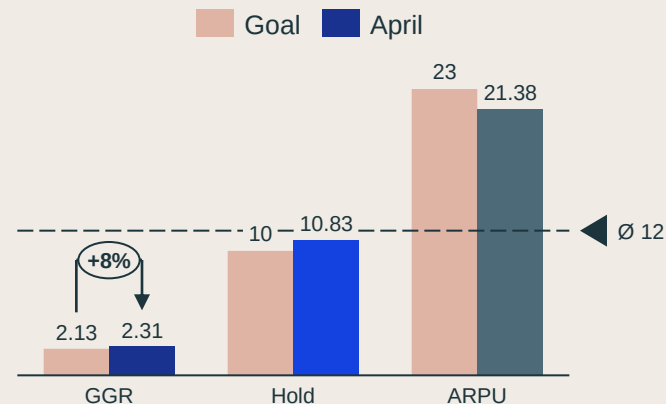

Overall good performance but still room for improvement

Sales Summary

High-level takeaways

- 107.93K clients bet on April.
- 99% was in Football and from Asia, as expected.
- These clients wagered a total of 21.3M SGD.
- We were able to hold 2.31M of the total stakes.
- That gave us a hold percentage of 10.83%, which is within the healthy range for this kind of business (7-12%).
- Our overall ARPU is at 21.38. Giving the most of our bets are from Asia, a healthy range for this kpi falls between 15-30, which is great.

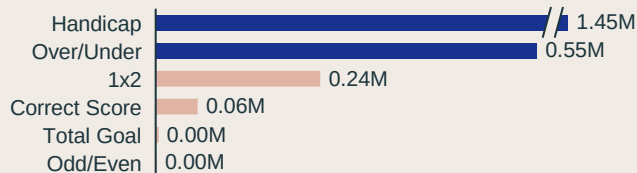

Sales Summary

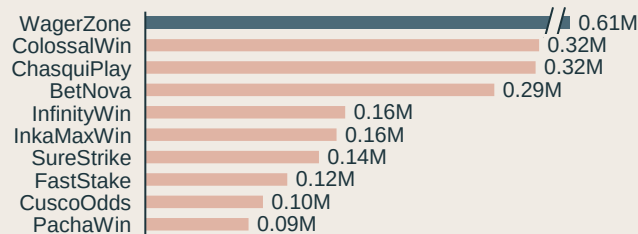

Drill-down takeaways

- 90% of our revenue comes from **Handicap and Over/Under** bets.
- The **most profitable websites** are **WagerZone**, **ColossalWin**, **ChasquiPlay** and **BetNova**, which all together **brought 60% of the total profit**.
- The **least profitable websites** are **PachaWin** (6.75%), **FastStake** (5.99%) and **SureStrike** (6.21%). They fall behind the healthy range.
- Since the **Champions League** is almost at its peak in April with its knockout phase, it makes sense **that it was the top league in number of bets and GGR**.
- Even with a higher GGR value, **the worst league is the Primera Division from Mexico**, with the lowest KPIs performance.

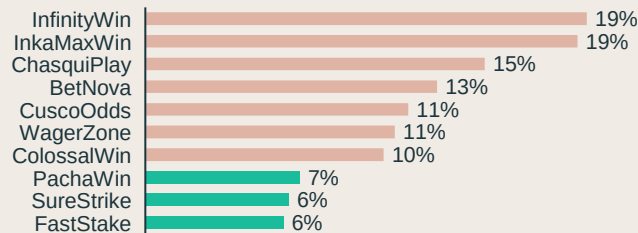

GGR by type of bet

GGR by Website

Hold % by Website

03

Core Insights and Recommendations

Did you know we make more profit when our clients bet before matches?

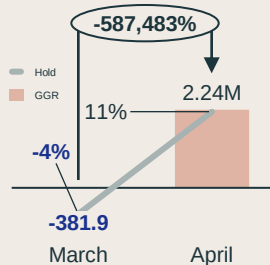

Core Insights

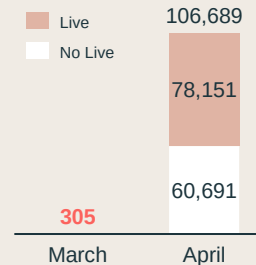

- In march, **we had only 305 clients for Football** and all bets were before matches, comparing to almost 107K in April and 57% of bets were live.
- Unlike April, **Football had all its KPIs in negative in March, because** lost bets (404) came from **Casual** clients (7.21%). While winning bets (155), even when being lower, they came from **Whale** (41%), **Serious** (14.72%) and **Casual** (20.23%).
- Basketball reduced its hold rate by 21 percentage points**, caused by the winning ratio going from 46.47% to 73.84% in April. Additionally, **Serious** and **High-Stakes** stakes' share grew from 31.06% to 39.44% and from 17.64% to 24.23% respectively.
- In addition, **it managed to keep 86.65% of the clients** from march, achieving a churn of 13.35%.

Football

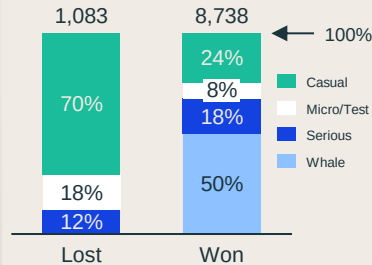

Performance

Clients by live bet

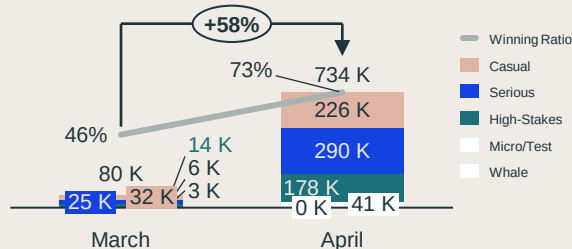

Payouts share by type of client

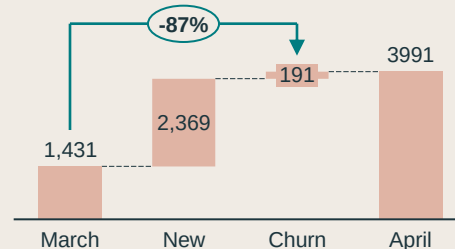

Basketball

More won bets by sharp clients hurt our hold rate

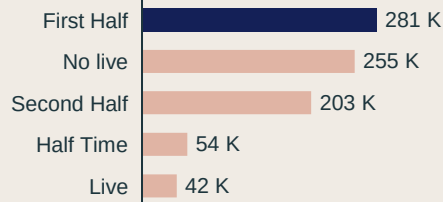

Good retention by industry standards

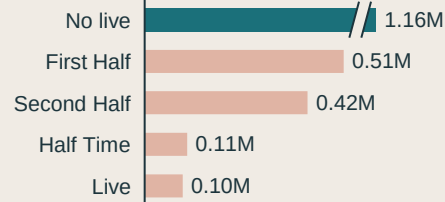

Core Insights

- Most of our bets are made during the first half, but the **most profitable** are the ones made **before the matches**.
- Furthermore, **no live bets** have a hold rate of **14% vs 8.81% of live ones**. Also, the **winning ratio** is **lower with a 48.97% vs 62.41%**. It's the perfect combination for a higher GGR.
- The **winning ratio** is our strongest enemy. In April, we saw variation from 44.66% to 59.05%.

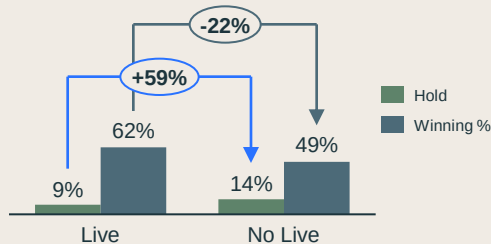

Number of bets by time

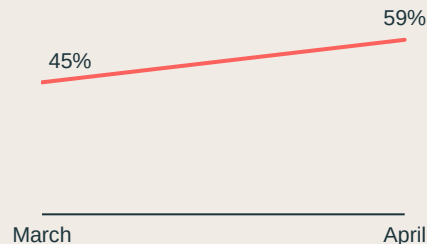

GGR by time

No live bets are better

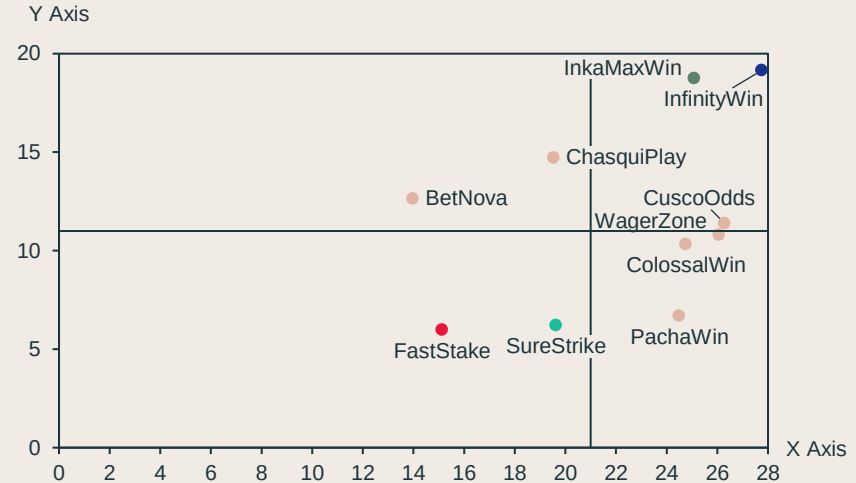

Overall winning ratio

Recommendations

- Giving that our winning ratio is bigger in April, we should look to reduce it by managing better our odds.
- We should have an aggressive targeted campaign to get more clients to bet before the matches. It is our most profitable time.
- A healthy monthly **churn rate** for old clients **should be no more than 20%**. Basketball had 13.35%, **led by good hold and arpu values**. These should be our main priority to increase GGR and reduce the churn.
- I strongly suggest to work first with the websites **FastStake** and **SureStrike**. There is high probability of churn in the next month and a poor revenue.

Our goal must to eventually move all our websites to second quadrant, where **InfinityWin** and **InkaMaxWin** are. Peak performance.

04

Predictive Analysis and Conclusions

May can be better than April with less clients

Predictive Analysis

- **May is the last month of the Premier League, so there is a probability that the champion is defined that month.** More viewership, more bets, but not necessarily more money bet.
- At the same time, **there is also a probability that the champion is defined at the end of April.** This means less viewership on May, but not necessarily less money bet, since the money can be distributed to other “safer” bets.
- **There is always a date at the end of may where matches are played simultaneously.** This day is always a great peak which can increase or reduce our overall hold percentage. Generally, it translates into +1% or +2%.
- **So far, our stake and hold rate are not that safe to bet on for a prediction.** So, based on Gambling Commission reports, which tell us that at the end of quarters of the year, active accounts or users tend to drop around **7-14%**, but at the same time, **the revenue can be higher with less users.**
- Based on the source **I will assume our number of clients will drop by 14% from April to May, but the Stake Per User will maintain from April.**

I am predicting May with less total stake, but if our hold percentage increases, we can have a better GGR than April.

Currency	April			May	
	Stake	Clients	Stake Per User	Clients	Stake
IDR	1,825,943	23,449	78	20,166	1,570,311
THB	1,824,365	13,563	135	11,664	1,568,954
VND	173,447	1,195	145	1,028	149,164
USD	42,321	232	182	200	36,396
HKD	9,841	16	615	14	8,463
CNY	9,251	43	215	37	7,956
MYR	8,470	23	368	20	7,285
MMK	7,004	85	82	73	6,023
LAK	4,424	26	170	22	3,805
IDO	3,235	72	45	62	2,782
VNO	1,354	4	338	3	1,164
No Currency	477	20	24	17	410
BRL	390	30	13	26	335
AUD	87	1	87	1	75
BDT	3	1	3	1	2
NGN	1	4	0	3	1
Total	3,910,611	38,764	101	33,337	3,363,126

Conclusions

- It would have been great to have more historical data to understand clients and websites behavior more accurately.
- March was an atypical month for football bets, compared to April.
- Basketball had a great retention ratio. More historical of that cohort would be great to take a look at.
- What will make us more profitable (GGR) is the combination of healthy ARPU and HOLD.
- The winning ratio is our strongest enemy, because it affects our Hold directly and even more if sharp clients lead the way.
- Several websites have a good ARPU, which is a great indicator of good client's retention, but some are affected by the winning ratio and can't hold its real potential.
- Pre match bets are definitely more profitable. That's where our marketing team should invest on.
